

# Concurrent Autonomous Vehicle Navigation

by Alex Brooks, Monmouth College; Kendall Lewis, Humboldt State University; Scott Thede, Faculty Advisor, DePauw University

Problem
<ul style="list-style-type: none"><li>- <b>Autonomous</b> vehicles are driverless or self-driving vehicles.<sup>[1]</sup> Many systems exist, mainly for driving on streets (highways or local).<sup>[2][3]</sup></li><li>- This project's goal: come up with a model for multiple vehicles navigating and mapping a specified, flat region without the use of roads or markings</li><li>- The region is split up for vehicles to explore separate sections</li><li>- The region contains static obstacles, including free-standing objects and walls, that vehicles must detect and avoid</li><li>- The result of navigating the region is a coordinate-pair map or image-map indicating where the vehicles travelled and where obstacles exist</li><li>- The model is useful for classroom visualization of aspects such as Computer Vision, Robotics, Multi-Agent Systems, and Parallelism/Concurrency.</li><li>- The model is also useful for real-world applications such as exploring abandoned or dangerous buildings</li></ul>

Hardware Simulation
<ul style="list-style-type: none"><li>- Each vehicle made up of the following components:<ul style="list-style-type: none"><li>▪ RC car</li><li>▪ Arduino microcontroller</li><li>▪ Dual motor driver</li><li>▪ Tilt-Compensated Compass</li><li>▪ Xbee Wireless antenna</li><li>▪ Infrared Proximity Sensors</li></ul></li><li>- Arduino microcontrollers are inexpensive and easy to use<ul style="list-style-type: none"><li>▪ The code is stored on each vehicle, allowing it to drive itself</li><li>▪ Written using the Arduino programming language and environment</li></ul></li><li>- The RC car contains two motors; one responsible for turning, the other for driving</li><li>- Both motors controlled by Dual Motor Driver in order to navigate through region</li><li>- A Tilt-Compensated Compass determines vehicle's heading relative to Magnetic North</li><li>- Each vehicle has a Xbee Wireless antenna for communicating with master computer</li><li>- Master computer contains a Xbee Wireless antenna for signaling a vehicle to stop</li></ul>

Vision
<ul style="list-style-type: none"><li>- Computer vision can be simulated through:<ul style="list-style-type: none"><li>▪ still-images</li><li>▪ video</li><li>▪ ultra-sonic sensors</li><li>▪ infrared sensors</li><li>▪ lasers</li><li>▪ or other options</li></ul></li><li>- Sensors are placed in the locations as seen in Figure 1.<ul style="list-style-type: none"><li>▪ Provides an acceptable range of vision</li><li>▪ Allows for detecting obstacles and preventing collisions</li></ul></li><li>- Collision prevention is made possible by primary function of sensor:<ul style="list-style-type: none"><li>▪ Find the distance between the sensor and an obstacle.</li></ul></li></ul>
Communication
<ul style="list-style-type: none"><li>- Master-slave model used, where central computer (master) has control over all vehicles (slaves)</li><li>- A set of destinations is sent to each vehicle prior to navigation</li><li>- Communication not explored extensively, but two approaches considered:<ol style="list-style-type: none"><li>1) Once the set of destinations for a vehicle is empty, send the gathered information about travelled region to master computer</li><li>2) Once a destination is reached, send gathered information to master computer; once information is sent, delete from memory and proceed to next destination</li></ol></li></ul>

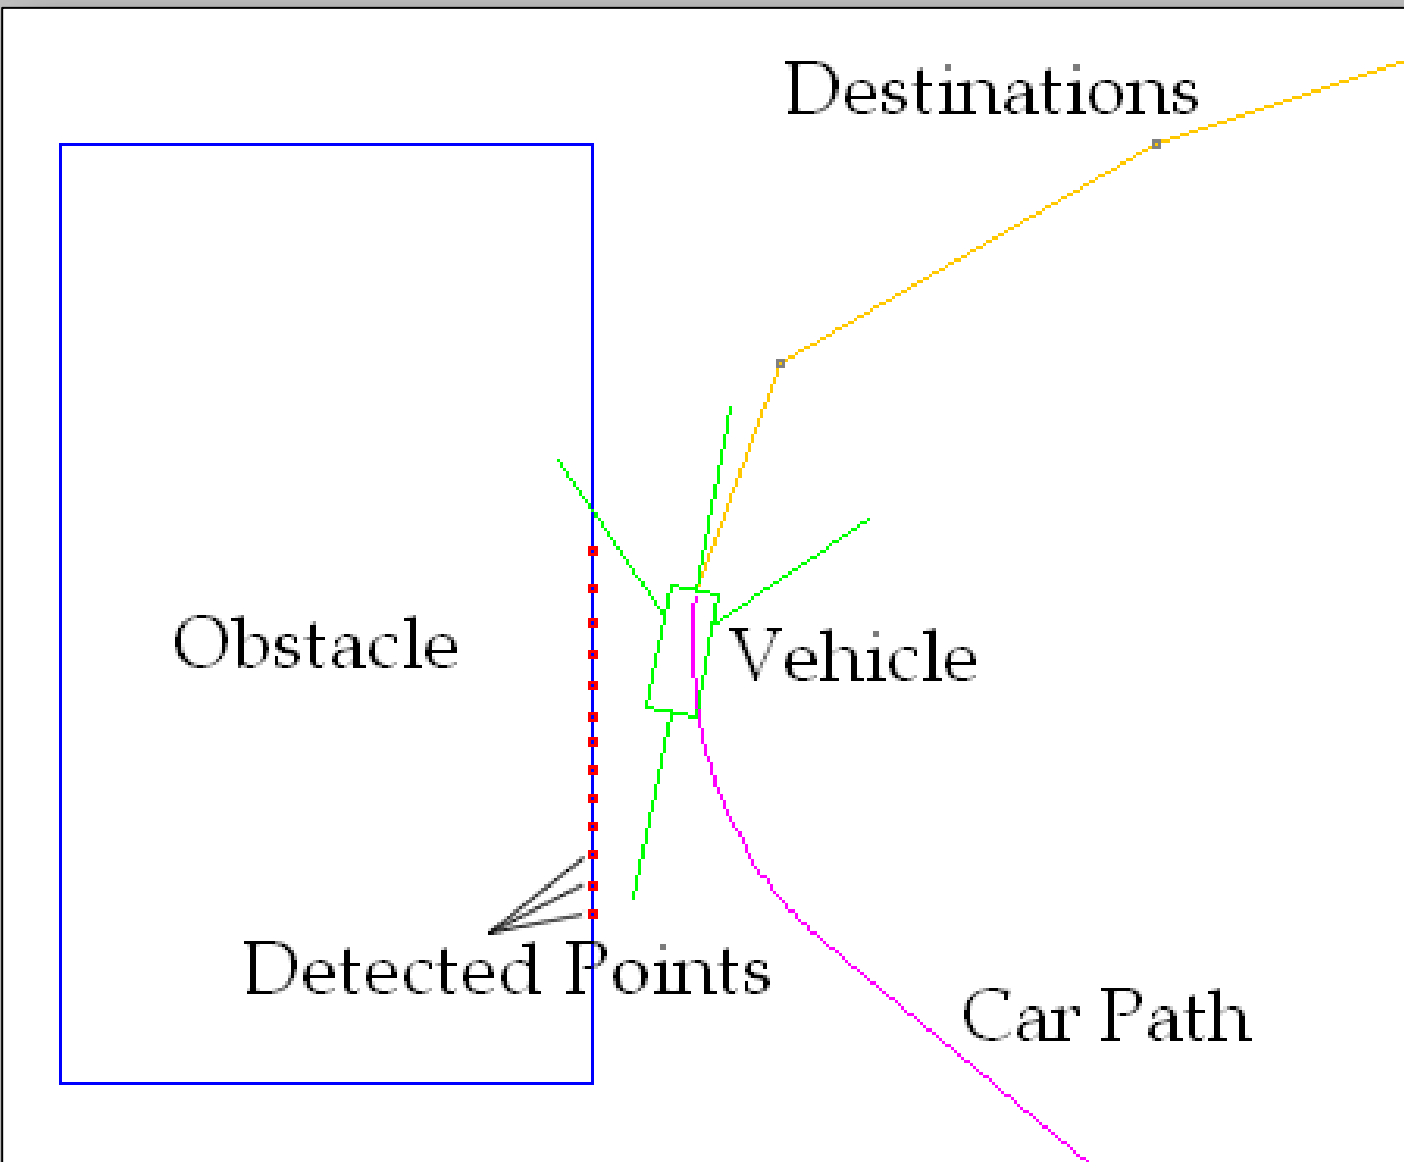

Figure 1

Navigation
<ul style="list-style-type: none"><li>- Vehicles are given sets of destination points in order to navigate through a region</li><li>- Each vehicle performs a set of instructions to navigate around obstacles if the shortest path is obstructed (See Figure 2)</li><li>- The destination is removed if unreachable, and the next one in the set becomes the new destination</li><li>- The navigation is complete once the set is empty</li></ul>
<div><div><p>Figure 2.1</p></div><div><p>Figure 2.2</p></div><div><p>Figure 2.3</p></div></div>

Software Simulation
<ul style="list-style-type: none"><li>- Simulation written in Java utilizing:<ul style="list-style-type: none"><li>▪ Threads library for concurrency in model</li><li>▪ Java-Swing library for handling Graphical User Interface (GUI)</li></ul></li><li>- Each vehicle consists of 3 threads:<ul style="list-style-type: none"><li>▪ One to calculate positions and visible obstacles</li><li>▪ One to send vehicle information to the overall model</li><li>▪ One to update the GUI</li></ul></li><li>- A file containing all properties of region and vehicle is loaded</li><li>- Destination points are generated and sent to vehicle</li><li>- Vehicles travel their respective paths until simulation is complete</li></ul>

Future Work
<p>Overall:</p> <ul style="list-style-type: none"><li>- Integration of the two simulations to provide better understanding of the overall model</li><li>- Simulate over different terrains, incorporate moving objects, and use different types of vehicles such as helicopters or marine vehicles</li><li>- Add possibility for simulating in 3-dimensions using video or still-image cameras<ul style="list-style-type: none"><li>▪ Will improve understanding of reactions of each vehicle to its surroundings</li></ul></li></ul> <p>Software:</p> <ul style="list-style-type: none"><li>- Determine which visible points are a part of the same object and remove redundant/unneeded points</li><li>- A better system is needed for allowing multiple vehicles to start in any position of the region</li></ul> <p>Hardware:</p> <ul style="list-style-type: none"><li>- Incorporate a method for determining the position of a vehicle; two approaches considered:<ol style="list-style-type: none"><li>1. Determine the speed of a vehicle and use its heading to determine position</li><li>2. Integrate GPS for a more absolute position</li></ol></li><li>- Once positioning is incorporated, communicate positions and visible points to master computer</li></ul>

Acknowledgements
<ul style="list-style-type: none"><li>- We would like to thank the National Science Foundation for funding the REU Program, under grant CNS-1156893.</li><li>- We would also like to thank DePauw University for hosting our project and providing us with the necessary resources to conduct our research.</li></ul>
